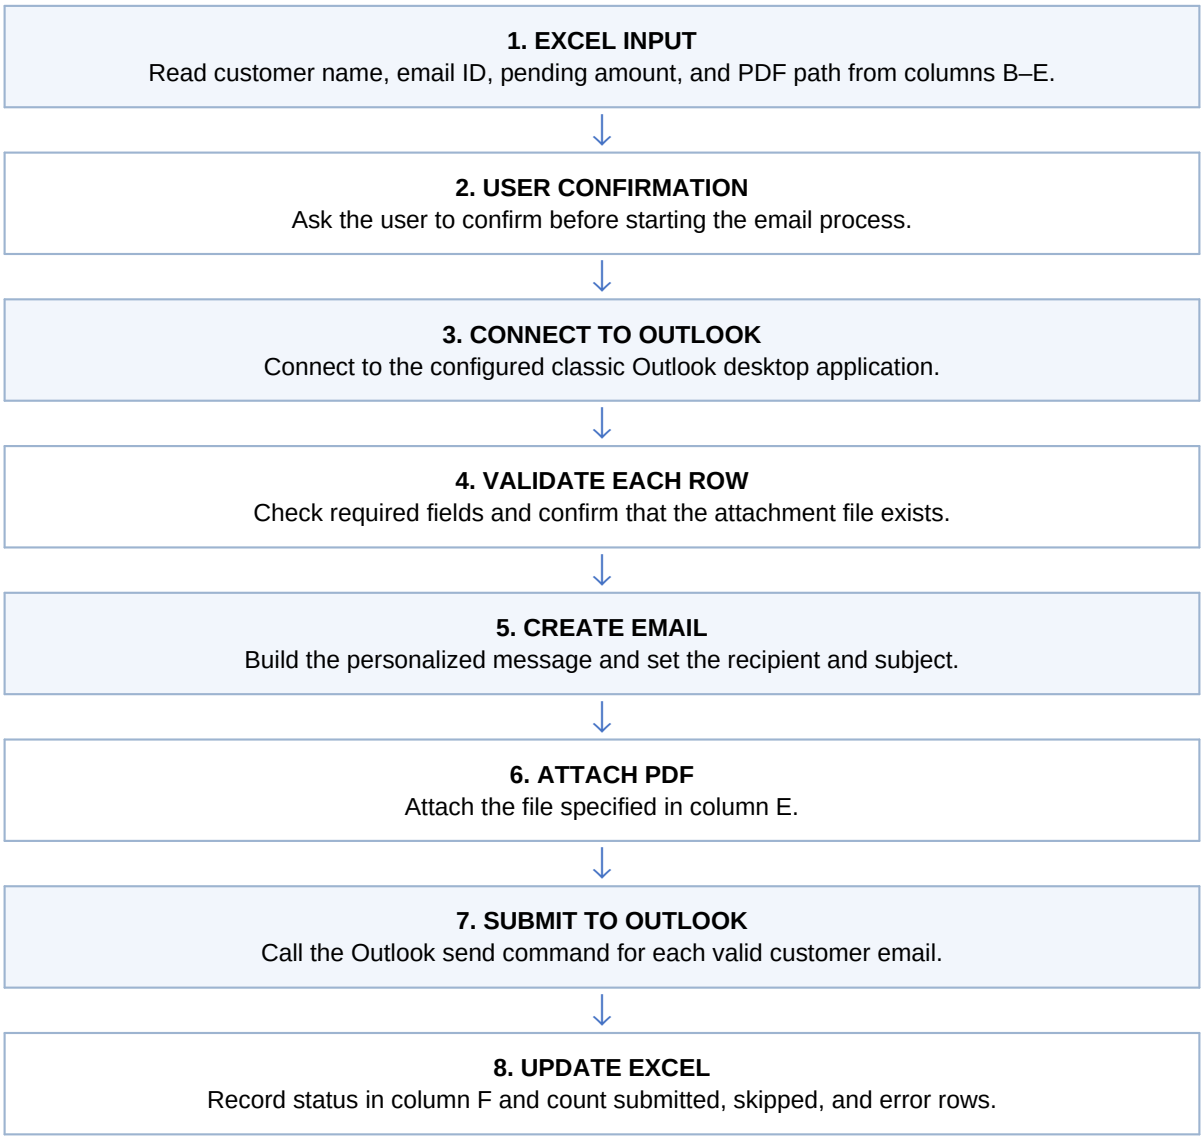
Excel VBA Customer Email Automation

Project Workflow | Excel + VBA + Classic Outlook Desktop

Purpose: automate personalized pending-payment emails by reading customer details from Excel, validating data and PDF paths, creating an email for each valid row, and tracking the processing status.



Excel Column Mapping

Column	Purpose
B	Customer Name
C	Customer Email ID
D	Pending Amount
E	Full path to the customer's PDF attachment
F	Processing status (submitted, skipped, or error)

Validation and Error Handling

• Rows with missing required information are skipped and marked in column F.

• Rows whose attachment path does not point to an existing file are skipped.

• Row-level errors are recorded so the user can identify which customer row needs attention.

• The macro’s status indicates that the email was submitted to Outlook; it does not guarantee delivery.

Requirements

Microsoft Excel with VBA support, classic Outlook desktop configured with an email account, valid recipient addresses, and accessible attachment file paths.

Important Testing Note

Test with one row and a PDF sent to your own email address before processing real customers. Check Outlook Outbox, Sent Items, and any delivery-failure notices. Avoid uploading real customer names, email addresses, payment details, or confidential attachments to a public repository.
